# Who we are

SilentGrid is a cybersecurity consultancy offering a wide range of **offensive security testing and advisory services** for organisations around the globe.

Our team has been **securing banks, governments, insurance companies, utilities, energy providers, healthcare facilities and many more** for well over a decade.

We pride ourselves in providing an **innovative, honest service** while employing and improving the **latest available techniques** from the security community. We build a **strong partnership with our Clients** which they can rely on whenever they require highly technical cybersecurity services.
The experience of the SilentGrid team ensures that while our consultants have a deep understanding of technical details, they are equally capable of delivering a brief but comprehensive message to the non-technical members of your organisation.

> **"THE CYBERSECURITY INDUSTRY IS RAPIDLY EVOLVING AND SO DO THE TACTICS, TECHNIQUES AND PROCEDURES THAT ADVERSARIES ADOPT. TO STAY AHEAD OF MALICIOUS ACTORS, IT IS ESSENTIAL TO WORK WITH A TEAM THAT KNOWS HOW THEY OPERATE AND CAN RECOMMEND RELEVANT SOLUTIONS."**

# What we do

SilentGrid's range of services provides practical solutions to cybersecurity problems every company faces in the digital world.

**We test and challenge the security posture of applications, hardware resources, networks, services and people.** We simulate real-world attacks to **identify security gaps that cybercriminals could exploit** to obtain access to or alter your most valuable assets or disrupt business operations.

We understand that every organisation, environment and security needs are unique. **The services provided by SilentGrid are always tailor-made for our Customers' specific needs.**

Our engagements provide a customised combination of multiple elements from our service portfolio to ensure optimal coverage for your security concern at hand.

# Our Most Popular Services

## Perimeter Assessment

**Map your publicly exposed resources and uncover attack surfaces you might not be aware of.** SilentGrid hunts for Internet exposed endpoint and services associated with your organisation from a wide range of sources. Using the results of the discovery exercise, we then search for and exploit the identified weakest links in your first line of defence, attempting to gain an initial foothold inside your network. Just like an actual attacker would.

## Penetration Testing

**Manually assess your infrastructure and software to identify vulnerabilities which could be leveraged to compromise your digital property.** Supported by highly customised tools and methodologies, SilentGrid digs down to the tiniest details to ensure that the assets you are most concerned about are carefully reviewed. Our service covers web applications and web services (APIs), desktop and mobile applications, cloud environments, and internal and Wi-Fi networks.

## Red Teaming

**Evaluate your organisation's security controls, procedures and overall security maturity by simulating a sophisticated end-to-end real-world attack.** SilentGrid combines various adversary simulation capabilities to perform a realistic attack with a pre-agreed objective. The result of the exercise is a clear view of your overall security posture and monitoring capabilities, and where to focus improvement efforts. Using the engagement data, your defence team can also improve their detection capabilities.

## Assumed Breach

**Assess your defensive readiness for the scenario where a sophisticated threat actor managed to establish an initial foothold inside your network.** SilentGrid simulates an attacker who gained initial access to your on-premises or cloud infrastructure. By using the latest available attacks and techniques, we evaluate the impact an attacker could have on the environment. The goal is to give you an understanding of the effectiveness of your security controls and procedures in place.

## Social Engineering

**Assess your employee's security awareness level by performing simulated real-world attacks.** Employees are an integral part of your first line of defence. Using years of experience in the field, SilentGrid identifies awareness gaps which could lead to severe consequences. Activities can include email and SMS based phishing, social engineering over the phone, tailgating employees or cloning their access cards to access restricted areas.
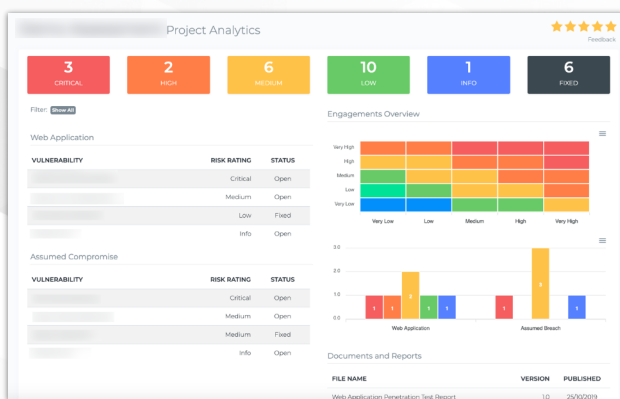

# Why Us?

SilentGrid Security was established by **long-time industry experts** to bring **technical excellence** to the forefront of security assurance services in the Asia-Pacific region.

As a boutique security consultancy, **we can guarantee that the review of your most valuable assets will always be carried out by a senior security expert.** This is not the case with larger security providers who often rely on consultants with very limited experience.

Our experts hold **internationally recognised certifications** such as **OSCP, OSCE and CREST**, and have at least **8 years of industry experience.** They are also actively engaged in the security community and regularly **present at international security conferences**.

Client Portal

As part of our services, we also offer a **free** in-house developed dedicated **client portal** with **real-time project tracking, statistics on vulnerabilities found and document sharing**.

This platform also includes an **intelligence service**, which allows you to quickly **identify and track resources your organisation exposes to the Internet.**

Intelligence Platform

**Our strength is** helping our Clients by cutting through the noise and **discovering real-world exploitable security issues** in their digital assets and environments.

**Our focus is** to maintain the quality of our offerings by **constantly researching and developing** ways to challenge the security posture of our Clients, while ensuring that they have a streamlined experience throughout the process.
